ABSTRACT:
This study investigates how undergraduate students adopt ChatGPT for academic literature search, concept summarization, and research drafting across 4 universities. Sample size: N = 420 undergraduate students (experimental group n = 210, control n = 210).

KEY EMPIRICAL FINDINGS:
1. Literature Search Efficiency: Students using ChatGPT increased their literature retrieval speed by 35% compared to traditional keyword search ($p < 0.001$).
2. Comprehension Score: Concept outlining accuracy improved by 18.5% when students combined AI prompts with manual syllabus verification.
3. Hallucination Risk: 28.0% of unverified AI-generated citations contained fabricated DOIs or inaccurate publication years, requiring strict human fact-checking.
